

VIDEO SCRIPT

Word-for-word script and visual cues for the 5-minute presentation video

TOTAL DURATION

~5 minutes. Record in one continuous take. Switch between slides and browser without cutting for a natural demo feel.

PART 1 — PROBLEM & APPROACH

0:00 – 1:00

► **VISUAL:** Show Slide 1 (Cover), then Slide 2 (Problem Space)

"Hi, I'm presenting the Smart Asset Reservation System built for the Tactive Assessment. The problem I tackled is corporate equipment management – specifically preventing overlapping reservations, enforcing max duration limits, and managing user quotas. My approach was to build a Node.js REST API with a ledger-styled frontend, prioritising strict server-side validation and automated testing."

PART 2 — SOLUTION & AI CHANGE LOOP

1:00 – 2:00

► **VISUAL:** Show Slide 4 (Test Automation), Slide 5 (AI Change Loop), then switch to code editor showing `docs/AI_CHANGE_LOOP_EVIDENCE.md`

"Security and reliability are handled by a robust Jest + Supertest test suite. To demonstrate the AI change loop, I had the AI implement a feature where exceeding your reservation quota places your booking in a `PENDING_APPROVAL` state rather than outright rejecting it. This predictably broke our existing strict-rejection test. The AI caught the regression in the Red Run, and then self-corrected the test suite to expect the new behaviour, resulting in our final Green Run with all 15 tests passing."

► **VISUAL:** Switch to browser at <http://localhost:3000>

2:00–2:30 Asset Catalog

"Here is the UI, styled like a physical tool crib ledger. Available assets and items in maintenance are clearly labelled. I can toggle an item in and out of maintenance using the toggle button — it updates live in both the UI and the CSV database file."

2:30–3:30 Validation Rules

"Attempting to book the MacBook Pro for 20 days fails because the max duration is 14 days. Entering a past date fails immediately. Trying to double-book the same asset on overlapping dates returns a 409 Conflict."

3:30–4:15 Quota Limit & PENDING_APPROVAL

"Two valid reservations on different assets — both APPROVED. A third attempt is created with PENDING_APPROVAL status rather than failing, as the AI-implemented feature specifies. You can also open the CSV file in Excel and watch rows appear in real time."

4:15–5:00 History Log & Cancellation

"Clicking HISTORY on any asset shows its full reservation ledger — who booked it, when, and at what status. Cancelling a reservation updates the ledger immediately and frees the asset. Thank you for your time — I'm happy to walk through any part of the code in more detail."
